

# EDA: Characterizing the relationship between the religious affiliation and incidences of Covid-19 at U.S. universities.

Daniel de Castro and Laura Appleby

November 22, 2022

For this exploratory data analysis, the first step is to read our data from CSV files into R data frames. The `colleges` data frame stores the NYT data on Covid cases at universities, while the `ipeds` data frame stores the data with most of our predictor variables (university characteristics) taken from IPEDS. We then rename most of the columns in `ipeds` to make them shorter and easier to work with.

```
# Read colleges from csv
colleges <- read.csv("data/colleges.csv")[,-c(1,9)]

# Read ipeds from csv, drop unnecessary columns
ipeds <- read.csv("data/ipeds.csv")
ipeds <- ipeds[-c(3, 8, 22)]

# Rename columns of ipeds
ipeds <- ipeds %>% rename_at('IC2021.Institutional.control.or.affiliation',
                             ~'control') %>%
  rename_at('HD2021.FIPS.state.code', ~'FIPS.state.code') %>%
